Forward Swing Base Instructions

Thank you for purchasing MHP mounting hardware with the Forward Swing Feature. This Forward Swing base is made with a Terra Cycles Glide Flex stem, one of the best tilting stems on the market.

Greenspeed GTO with OnePoint mount and Forward Swing Feature.

The Glide Flex stem has several important features you should know about for the best adjustment of your fairing mounts.

1. The pinch clamp is factory installed and tightened to 60 inch pounds. Do not tighten further.
2. The Tension Adjustment for the Forward Swing feature is located on the left side of the Glide Flex stem when installed properly on your vehicle.
3. The Angle Adjustment screw is located on the right side in the hinge of the Glide Flex stem. Use this screw to adjust how far back the fairing sits in the riding position (pulled back.) This allows you to adjust the fairing position independent of base location on the frame of the vehicle.
4. Do not clamp the bottom of the T bar moustache higher than the Minimum Insertion line of the Glide Flex stem.

If things just aren't working right give me a call toll free. I will do my best to help you out.
